SECTION 4 Running the System

Chapter 11 How to run A/B tests properly

Chapter 12 Your 90-day conversion improvement plan

Introduction

Let me tell you about the three-word change that doubled a company's revenue.

Going is a SaaS company that sends flight deal alerts. Their primary landing page had a button that said 'Start Free Trial'. They ran a single A/B test. They changed three words: 'Start Free Trial' became 'Get Premium Access'. Nothing else on the page changed. Not the headline, not the layout, not the price, not the offer.

Trial starts increased by 104% month-over-month.

That is not a typo. One hundred and four percent. From three words.

This book is about that kind of leverage. Not the big expensive redesigns. Not the nine-month development cycles. The specific, measurable, evidence-backed changes that move the number that matters — the percentage of visitors who become paying customers.

What this book is based on

Everything in these chapters comes from published experiments, named case studies, and large-scale benchmark reports. Not theory. Not opinions dressed up as advice. Actual tests, run on actual pages, with actual results.

The main sources include Unbounce's 2024 Conversion Benchmark Report — which analysed 41,000 landing pages and 57 million conversions. First Page Sage's SaaS free trial benchmarks from 86 SaaS clients over four years. ProductLed's PLG benchmark study across 600+ SaaS companies. And case studies from Going, Hotjar, DashThis, WikiJobs, Vodafone, Rakuten, Walmart, and Amazon — all with published, verifiable numbers.

Where I use a number in this book, it comes from one of these sources. I will tell you where. You can check.

Who this is for

This is for founders and marketing managers at early-stage and growth-stage SaaS companies who have a landing page and want more of the people who visit it to sign up. You do not need a CRO specialist or a large team. Every technique in this book can be tested with a free or low-cost tool.

Chapter 12 is a 90-day plan that sequences everything into a practical schedule. If you read nothing else, read that chapter. But the chapters before it will tell you why the plan is structured the way it is — and that understanding is what stops you from abandoning it when results are slow to appear.

SECTION 1 WHAT CONVERSION ACTUALLY MEANS

Before you change a single word on your landing page, you need to understand what conversion optimisation actually is, how visitors make decisions, and what the numbers on a high-performing page actually look like. The three chapters in this section cover all of that.

Chapter 1 — Why Most Landing Pages Underperform

Most SaaS landing pages are built by people who know the product extremely well and are trying to explain it as completely as possible. That is the problem.

When you know your product inside out, you write for the version of yourself that already understands it. You use the vocabulary of your industry. You describe features in technical terms because those terms are precise. You include every capability because you want prospects to see the full picture.

The person reading your page is not that person. They arrived with a problem. They have forty-seven seconds — that is the average attention span measured on landing pages in Unbounce's 2024 benchmark report. They are not reading your page. They are scanning it for one signal: does this solve my problem, and can I trust that it does?

The comprehension trap

Here is the counterintuitive finding that comes up again and again across every large-scale landing page study: simpler copy converts better. Not slightly better. Dramatically better.

Unbounce analysed 41,000 SaaS landing pages and 57 million conversions. Pages written at a 5th to 7th grade reading level — simple sentences, plain vocabulary, no jargon — converted at 12.9%. Pages written at college reading level converted at 2.1%. That is a six-times difference, and the only variable is how complicated the writing is.

6×

More conversions from plain English

Pages at 5th–7th grade reading level convert at 12.9% vs 2.1% for college-level copy. Source: Unbounce 2024 Conversion Benchmark Report, 41,000 pages.

The reason is not that your visitors are unintelligent. It is that reading online requires effort, and people are rationing that effort. When your copy is easy to scan and understand immediately, visitors spend their cognitive energy on deciding whether to sign up. When they have to work to understand your copy, they spend their cognitive energy on comprehension — and run out before they get to the decision.

The three questions every visitor is asking

Before a visitor converts, they need satisfactory answers to three questions. In order.

QUESTION

WHAT ANSWERS IT

1. Is this for me?

The headline. Visitors decide in seconds whether the page is relevant to their situation.

2. Can I trust this?

Social proof — testimonials, logos, numbers. Trust signals determine whether they continue reading.

3. Is it worth doing now?

The CTA. The offer, the commitment required, and the immediate next step.

Most landing pages try to answer question 1 with a feature description instead of a benefit statement. They put social proof at the bottom of the page where most visitors never reach. And they use a CTA that focuses on what the company gets ('Start Free Trial') rather than what the visitor gets ('Get Premium Access').

Fix those three things and you have fixed most of what is wrong with most SaaS landing pages.

PRO TIP The 5-second test

Show your landing page to someone who has never seen your product. Set a timer for five seconds. After five seconds, close the page and ask them: what does this product do, and who is it for? If they cannot answer confidently, your headline is not clear enough. This test costs nothing and catches more problems than any analytics tool.

What most pages get wrong about length

There is a persistent myth in content marketing that longer pages convert better because they have more space to persuade. Unbounce's data suggests the opposite for SaaS landing pages.

The optimal word count range for SaaS landing page conversion is 250 to 725 words. Below 250 is often too sparse to build sufficient trust. Above 725, conversion rates start to decline — not because visitors read the whole page and feel overwhelmed, but because longer pages signal complexity. Visitors who see a long page before they have decided to engage tend to bounce.

The exception is pages for high-ticket B2B SaaS where the visitor has already done research and needs detailed information to make a business case internally. For those, longer pages can convert better. But they are the exception, not the rule.

KEY TAKEAWAYS

- ✓ The average visitor has 47 seconds of attention on your landing page. Write for scanning, not reading.
- ✓ Simple copy (5th–7th grade) converts at 12.9%. College-level copy converts at 2.1%. Six times difference — only variable is complexity.

- ✓ Every visitor is asking three questions in sequence: is this for me, can I trust this, and is it worth doing now? Make sure each is answered clearly.
- ✓ Optimal page length for SaaS is 250–725 words. Outside that range, conversion rates decline in both directions.

Chapter 2 — How Visitors Decide — and How Fast

There is a version of conversion optimisation that treats visitors as rational decision-makers who weigh features against price and reach a logical conclusion. That version is wrong.

Visitors make snap judgements based on visual signals, emotional responses, and trust signals — and then they rationalise those judgements afterwards. Understanding this changes which elements you prioritise on the page.

The role of the hero section

The hero section — the top of the page, visible before any scrolling — is doing more work than any other part of your page. It is the only section that every visitor sees. It is where the first snap judgement happens.

Research on B2B SaaS landing pages found that pages with visual product demonstrations in the hero — a short GIF, a product screenshot, or a brief video clip showing the product doing something useful — consistently outperformed pages with abstract lifestyle imagery or text-only heroes. The reason is simple: a product demo answers 'is this for me?' faster than any written description.

PRO TIP Hero section priority

The hero section has one job: make it immediately obvious what the product does and who it is for. Everything else — features, pricing details, social proof — comes later. If your hero is doing anything other than that single job, it is working against you.

Traffic source changes everything

One of the most important findings in Unbounce's 2024 benchmark report is how dramatically conversion rates vary by traffic source. The same landing page, receiving traffic from different channels, can show wildly different conversion rates.

TRAFFIC SOURCE	AVERAGE SAAS CONVERSION RATE
Email	19.3% — visitors who already know you and chose to click
Organic search	3.8% median — visitors with intent but no prior relationship
Paid search	1.5% — visitors who clicked an ad
Social media	Lower — visitors who were not specifically looking

Email converts at four times the all-channel median. The reason is not that email is magic — it is that email visitors are warm. They already have a relationship with your brand, they chose to click, and they arrived with prior context. The page needs to do much less work for them.

This matters practically because it means you should have different landing pages for different traffic sources. A visitor from a paid Google search for 'project management software' needs a different page than a visitor who clicked a link in your newsletter. They are at different stages of familiarity with you. Sending both to the same generic page is leaving conversion rate on the table.

School of Rock ran paid campaigns sending traffic to their generic homepage.

They created campaign-specific landing pages matching the exact messaging of each ad.

Result: conversion rate doubled on campaign-specific pages vs generic homepage.

The change: the visitor's expectation (set by the ad) matched what they saw on the page.

When the ad says 'guitar lessons for adults' and the page says 'guitar lessons for adults',

the visitor's brain registers: I am in the right place. Conversion follows.

Source: Unbounce CRO Case Studies 2025.

Navigation: remove it from dedicated landing pages

This one surprises most founders the first time they hear it, but the data is consistent across many experiments: removing navigation from dedicated landing pages increases conversion rates.

The logic is straightforward. Every navigation link is an exit path. When a visitor arrives on a landing page, your goal is to get them to take one specific action. Every other link on the page competes with that action. By removing navigation from dedicated campaign pages, you concentrate visitor attention on the single conversion goal.

Note that this applies to dedicated landing pages — pages built specifically for a campaign or traffic source. Your homepage and product pages should retain navigation, because visitors to those pages often have exploratory intent and need to be able to find what they are looking for. But a page built around one offer, for one traffic source, should have one action available: the conversion.

KEY TAKEAWAYS

- ✓ Visitors make snap judgements based on visual signals and emotional responses, not rational feature comparisons.
- ✓ Email traffic converts at 19.3% — four times the all-channel median. Use dedicated pages for each traffic source, matched to the visitor's prior context.
- ✓ A visual product demo in the hero section outperforms abstract imagery for answering 'is this for me?' faster.
- ✓ Remove navigation from dedicated landing pages. Every navigation link is an exit path that competes with your conversion goal.

Chapter 3 – Benchmarks: What Good Looks Like

Before you start optimising your landing page, you need to know what you are optimising towards. 'More conversions' is not a target. It is a direction. What you need is a number — a realistic benchmark for what a well-optimised SaaS landing page should convert at, given your traffic source and business model.

This chapter gives you those numbers, drawn from the largest published datasets on SaaS landing page performance.

The benchmark table

These numbers come primarily from Unbounce's 2024 analysis of 41,000 pages, First Page Sage's benchmarks from 86 SaaS clients over four years, and ProductLed's study of 600+ SaaS companies. Where there is variation between sources, I have used the more conservative figure.

METRIC	BENCHMARK	WHAT IT MEANS
SaaS landing page → sign-up (organic)	3.8% median	Half of pages convert below 2%; top quartile above 6%
SaaS landing page → trial (email traffic)	19.3%	Email is your highest-converting channel by far
Free trial sign-up → paid (opt-in, no CC)	18.2%	Opt-in trials attract volume; paid conversion is moderate
Free trial sign-up → paid (opt-out, CC)	48.8%	Fewer trials but nearly 3× the

req.)		paid conversion rate
Freemium sign-up → paid	2.6%	High volume at top; very low monetisation rate
PQL-driven trial → paid	~25%	Product Qualified Leads convert at 3× non-PQL median
B2B SaaS lead conversion (organic)	1–3%	Lower intent traffic; longer sales cycle

A few things to notice in that table. First, 3.8% median means half of all SaaS landing pages are converting at below 3.8%. If your page is converting below 2%, you are not in unusual company — but you also have a lot of room to improve. Second, the gap between opt-in and opt-out trial conversion rates is enormous. We will discuss how to choose between them in Chapter 8. Third, PQL-driven conversions are three times better than the median. If you are not using product signals to identify who to prioritise, that gap represents real money.

Industry variation

The median figure of 3.8% is across all SaaS categories. Individual verticals vary considerably. Here are the vertical benchmarks from First Page Sage and 1Capture's combined data.

SAAS VERTICAL

TRIAL-TO-PAID CONVERSION BENCHMARK

CRM SaaS

29% — highest performing vertical

Healthcare IoT SaaS

25.2%

Healthcare SaaS (general)	21.5%
B2B SaaS median	18.5%
Freemium products (all verticals)	2.6% free → paid

PRO TIP How to use these benchmarks

Do not use the industry median as your target. Use it as your floor. If you are converting at 1.2% and the median for your vertical is 3.8%, your first goal is to reach the median. Once you are at the median, your goal is the top quartile. Benchmarks tell you where you are relative to the field — they do not tell you what is possible for your specific product and audience.

The conversion rate you should actually optimise

Most founders optimise their landing page for visitor-to-trial conversion. That is the right place to start. But it is not the only metric that matters, and in some cases it is the wrong metric to optimise.

If your trial-to-paid conversion rate is very low — say, below 10% — increasing the number of trials you start will not solve your problem. You are bringing in more people who are not converting to paid. The bottleneck is not the landing page. It is the trial experience.

Before you invest heavily in landing page optimisation, check your full funnel. If visitor-to-trial is healthy but trial-to-paid is low, fix the trial first. Chapter 8 covers this in detail.

KEY TAKEAWAYS

- ✓ The SaaS landing page median conversion rate is 3.8% from organic traffic. Half of all pages convert below this. Email traffic converts at

19.3%.

- ✓ Opt-out (credit card required) trials convert trial users to paid at 48.8% vs 18.2% for opt-in — but opt-out reduces trial starts by 42-50%.
- ✓ PQL-driven conversion rates are 3× the non-PQL median (~25% vs ~9%).
- ✓ Check your full funnel before optimising your landing page. If trial-to-paid is very low, fixing the landing page will not solve the revenue problem.

SECTION 2 THE PAGE ITSELF

Section 2 goes through the four elements of the page that have the most consistent, evidence-backed impact on conversion: the copy and headline, the form, the trust signals, and the call to action. Each chapter covers what the research says and how to apply it without a design agency.

Chapter 4 — Headlines, Copy, and the Reading Level Rule

The most important sentence on your landing page is the first one. Not the subheadline. Not the bullet points. Not the testimonials. The first sentence that a visitor reads — which is usually the main headline — determines whether they continue reading or leave.

Most SaaS headlines describe what the product is. The ones that convert well describe what the product does for the person reading it. That distinction sounds minor. In practice it is the difference between a 2% conversion rate and a 12% conversion rate.

The benefit vs feature distinction

A feature is something your product has. A benefit is something your user gets. Feature: 'Automated reporting dashboard.' Benefit: 'Your Monday report done in three minutes.' Feature: 'AI-powered lead scoring.' Benefit: 'Your team calls the right leads automatically.'

When you write a feature headline, you are asking the visitor to do the translation work — to understand the feature and figure out how it applies to their situation. When you write a benefit headline, you do that work for them.

FEATURE HEADLINE

BENEFIT HEADLINE

Automated invoice management

Get paid on time, every time — automatically

Real-time collaboration tools

Your whole team, always on the same page

Advanced analytics dashboard

Know exactly what is working, without digging

through data

AI-powered email sequences

Send the right email to the right person, every time

PRO TIP The readability checker

Paste your landing page copy into [Hemingwayapp.com](https://hemingwayapp.com). It is free. Aim for grade 7 or below. Every sentence highlighted in red or yellow is a sentence that is costing you conversions. Rewrite it to be simpler — usually by breaking it into two sentences and removing the unnecessary qualifications.

Benefit-driven email subject lines and onboarding copy

The same principle that applies to landing page headlines applies to your onboarding emails. An A/B test on a B2B SaaS onboarding email sequence compared feature-focused subject lines ('New collaboration tools') against benefit-focused variants ('Get projects done 40% faster'). The benefit-driven variant produced significantly higher open and engagement rates — and the company rolled it out across all onboarding communications.

This matters for landing pages because onboarding emails are often the second page in the conversion sequence. A visitor who is not ready to sign up from the landing page may give you their email for a content offer. The emails they receive from that point are extensions of the landing page. The same rules apply.

Copy length: what the data actually says

The optimal word count for SaaS landing pages is 250–725 words. Below 250, pages often lack enough information to build trust. Above

725, complexity signals increase and visitors are more likely to feel overwhelmed before converting.

A more specific signal: pages with more than 50 to 140 polysyllabic words — words with three or more syllables — underperform compared to pages with fewer polysyllabic words, regardless of total word count. The number of complex words is a better predictor of conversion than total word count.

The practical implication: read through your page and highlight every word with three or more syllables. Replace each one with a simpler alternative where possible. 'Utilise' becomes 'use'. 'Implement' becomes 'set up'. 'Optimise' becomes 'improve'. These changes feel small and they have an outsized effect on readability.

KEY TAKEAWAYS

- ✓ Benefit headlines outperform feature headlines because they do the translation work for the visitor, not ask them to do it themselves.
- ✓ Target 5th–7th grade reading level. Use Hemingway App to check. The six-times conversion difference is real and well-documented.
- ✓ Optimal page length is 250–725 words. More impactful: reduce polysyllabic words — words with three or more syllables — as a specific readability target.
- ✓ Apply the same benefit-driven principle to onboarding emails and any copy the visitor sees after the landing page.

Chapter 5 — Forms and Lead Capture

The form is the moment of truth. Everything else on your landing page — the headline, the testimonials, the product screenshots — is persuasion. The form is where visitors either act on that persuasion or don't.

Most forms are longer than they need to be. And every unnecessary field is costing you conversions.

The field reduction rule

This is probably the single most replicated finding in conversion optimisation research: fewer form fields means more conversions. Not slightly more. Dramatically more.

Genesys Growth's 2026 landing page statistics report, aggregating data from multiple large studies, found that 81% of users abandon forms after starting to fill them out. The primary reason: the form felt too long. When form fields were reduced to five or fewer, completion rates approximately doubled.

Cobloom's SaaS-specific data showed a more dramatic version of the same pattern: reducing from 11 fields to 4 produced a 160% increase in form conversions.

160%

More conversions: 11 fields → 4 fields

Cobloom SaaS data. Every field you add to a form is a hurdle. Every field you remove is a conversion you recover.

The practical rule: ask for only what you actually need right now. You do not need someone's company size, phone number, and job title to

start a free trial. You need their email. Everything else can come later — after they have experienced value from your product.

The multi-step form exception

If you need to ask several questions — for example, if you need to qualify leads before sending them to sales — there is a way to do it without losing the conversion rate benefits of shorter forms. Multi-step forms break a long sequence of questions into pages of two or three questions each.

Venture Harbour tested multi-step forms against single long forms and documented a 300% increase in lead conversions. The reason is the 'foot in the door' effect: once someone has answered the first two questions and clicked Next, they are committed. The form feels shorter at each step, even though the total number of questions may be the same.

Venture Harbour replaced an 8+ field single form with a 3-step multi-step form.

Each step had 2-3 fields. Step 1: name and email. Step 2: company and role. Step 3: specific challenge.

Result: 300% increase in lead conversion rate.

Lead quality was maintained — same information collected, just in smaller chunks.

The psychological mechanism: people who have started something prefer to finish it.

Once they complete step 1, they are far more likely to complete the remaining steps

than they would be to fill out a single form with all 8+ fields visible at once.

Source: Venture Harbour CRO Case Studies.

Exit-intent popups: the most underused capture tool

Most visitors who leave your landing page without converting are gone forever. Exit-intent popups — shown when a visitor's cursor moves toward the browser's close button — are the last chance to capture something from that visit.

Hotjar placed an exit-intent popup on their pricing page for first-time visitors. The popup offered a free Action Plan in exchange for an email. In three weeks, the popup captured 403 leads. Of those leads, 3% converted to trial sign-ups. The popup has since generated approximately 70 leads per month on an ongoing basis.

The key detail: Hotjar used the popup only on the pricing page, only for first-time visitors. Showing exit-intent popups everywhere on every visit is annoying and counterproductive. Targeting them to high-intent pages — pricing, comparison, features — for visitors who have not yet converted produces measurable results.

PRO TIP Popup timing matters

Broomberg changed their blog popup trigger from immediate page load to 100 seconds of time-on-page. Blog leads increased 72%. The principle: an immediate popup interrupts before trust is established. A delayed popup reaches visitors who have already demonstrated interest by spending time on the page. The same content offer performs very differently depending on when it appears.

Forms on mobile: the hidden friction

Mobile devices now account for 79% of SaaS landing page traffic. But SaaS still converts 8% better on desktop than mobile. The gap is largely explained by mobile form friction: small touch targets, missing

autocomplete, and keyboards that obscure the form fields the visitor is trying to fill.

The fix for most of the gap: add HTML autocomplete attributes to every form field, make tap targets a minimum of 44 pixels, and test your form on a real mobile device before launch. Most form friction on mobile is not a design problem — it is an implementation detail that takes under an hour to fix.

KEY TAKEAWAYS

- ✓ 81% of visitors abandon forms that feel too long. Reducing from 11 to 4 fields produced 160% more conversions in Cobloom's SaaS data.
- ✓ Multi-step forms (2-3 fields per step) produce 300% more conversions than equivalent single long forms. Same total information, much better completion.
- ✓ Exit-intent popups on pricing pages, targeted to first-time visitors, produce consistent lead capture. Hotjar documented 403 leads in 3 weeks from one popup.
- ✓ Delayed popups (100 seconds of time-on-page) outperform immediate popups by 72% for blog lead capture.

Chapter 6 — Trust, Social Proof, and Why Logos Alone Don't Work

Every SaaS landing page has logos. You know the ones — a row of recognisable company names underneath a headline that says 'Trusted by' or 'Used by teams at'. They have become so ubiquitous that they have become almost invisible.

And the data confirms what the eye has started to suspect: logos alone are not doing much.

The logos vs testimonials experiment

comScore ran a controlled A/B test that has become one of the most cited experiments in landing page optimisation. They tested two versions of a page. Version A had client logos only. Version B had the same client logos plus customer testimonials.

Version A — logos only — produced a 43% conversion lift over the control. Version B — logos plus testimonials — produced an 84% conversion lift. The testimonials nearly doubled the impact of the logos.

84%
VS
43%

Logos + testimonials vs logos only

comScore controlled A/B test. Testimonials added nearly double the incremental conversion lift compared to logos alone.

The reason is that logos prove the claim 'companies like yours use this'. Testimonials prove 'people like you got results from this'. Both are social proof. But the testimonial answers a question the logo cannot: what was it like to use this, and did it work?

The WikiJobs finding

WikiJobs ran an even simpler version of the same experiment. They added three short testimonials to a product landing page that had none. Each testimonial was two to three lines long. They did not redesign the page. They did not change the headline, the offer, or the CTA.

Purchases increased by 34%.

Three testimonials. Two to three lines each. 34% more purchases. This is the highest-ROI change available to most SaaS landing pages, and it requires no technical work at all.

PRO TIP Testimonial placement

Put at least one testimonial directly adjacent to your lead capture form. Visitors who are hesitating at the point of conversion — which is the form — need trust signals at that exact moment. A testimonial at the bottom of the page does not help a visitor who is hovering over the form wondering whether to trust you. Place it right next to the form.

What makes a testimonial actually work

Not all testimonials are equally effective. A generic testimonial like 'Great product, highly recommend!' adds almost nothing. An effective testimonial does three things: names a specific problem the customer had, describes a specific result they got, and is attributed to a real person with a name, role, and company.

WEAK TESTIMONIAL

'Great tool, really easy to use.'
— Sarah

STRONG TESTIMONIAL

'We cut our monthly reporting time from 4 hours to 20 minutes. That's 40 hours per quarter back for my team.' — Sarah Chen,

Head of Analytics, Fintech Co.

'Highly recommend for any business!' — James

'We replaced three separate tools with this. Saved about £800/month and the setup took two hours.' — James Okafor, Operations Manager, 60-person agency

The specific numbers — 4 hours to 20 minutes, £800 per month — are what make the second versions credible. Vague praise is easy to fake. Specific results with numbers attached feel earned.

Video testimonials and case studies

Where you have them, video testimonials outperform written ones because they are harder to fabricate. A real person speaking candidly on camera about their experience with your product carries more weight than text that could have been written by anyone.

For most early-stage SaaS founders, getting a customer to record a two-minute video is surprisingly achievable. Most customers who love your product are happy to spend five minutes on a Loom recording if you make it easy for them. The barrier is usually the founder not asking, not the customer not being willing.

KEY TAKEAWAYS

- ✓ Logos alone produce a 43% conversion lift. Logos plus testimonials produce 84%. The testimonials are doing most of the work.
 - ✓ Adding three short testimonials to a page with none increased purchases by 34% in the WikiJobs test. This is the highest-ROI no-code change available.
 - ✓ Place at least one testimonial directly adjacent to your form. Trust signals need to be at the decision point, not at the bottom of the page.
 - ✓ Effective testimonials name a specific problem, a specific result, and include a real person's name, role, and company. Vague praise adds
-

almost nothing.

Chapter 7 — Calls to Action

Going changed three words on a button. Their trial start rate doubled.

That is the power and the frustration of CTA optimisation. The lever is tiny. The impact can be enormous. And there is no universal right answer — the CTA that works for one product and one audience will not necessarily work for another.

What the research gives us is not a magic formula. It is a set of principles for how to think about CTA copy, and a set of patterns that have worked consistently enough across enough experiments to be worth testing.

What 'Get Premium Access' understood that 'Start Free Trial' didn't

'Start Free Trial' describes an action the visitor is taking. 'Get Premium Access' describes something the visitor is getting. That is the entire explanation.

Visitors do not want to start a free trial. They want access to something that will help them. 'Start Free Trial' frames the CTA as a process. 'Get Premium Access' frames it as a reward. The visitor's mental model when they read the second version is not 'I have to go through a trial process'. It is 'I am getting access to something valuable'.

This principle generalises. The best CTAs describe what the visitor receives, not what they have to do to receive it. 'Get my free report' outperforms 'Submit'. 'Start saving time today' outperforms 'Sign up'. 'See how it works' outperforms 'Book a demo'.

PROCESS-FOCUSED CTA

VALUE-FOCUSED CTA

Start Free Trial	Get [Product] Free for 14 Days
Submit	Get My Free Report
Book a Demo	See [Product] in Action
Sign Up	Start Saving 3 Hours a Week
Create Account	Get Started in 2 Minutes

First person beats second person

Another finding that has been replicated enough times to be reliable: first-person CTA language outperforms second-person language.

'Start my free trial' outperforms 'Start your free trial'. 'Get my report' outperforms 'Get your report'. The difference is small — the visitor is clearly the subject either way — but studies report CTR improvements of up to 90% from the first-person variant.

The psychological mechanism is ownership. 'My free trial' creates a sense that the thing already belongs to the visitor. They are not applying for something. They are claiming something that is theirs. That distinction in framing is enough to change behaviour.

PRO TIP The urgency test

Adding urgency language — 'now', 'today', 'this week' — to CTA buttons produces approximately 10% CTR improvements in A/B tests across e-commerce and SaaS. This is not a dramatic effect, but it is consistent. If you are using evergreen CTAs without any urgency signal, adding 'now' or 'today' is a low-risk test worth running.

CTA placement and repetition

Your CTA should appear multiple times on the page if the page is longer than 500 words. At minimum: once in the hero section (above the fold), once in the middle of the page after you have presented your key proof points, and once at the bottom after any final supporting information.

The reason is that different visitors make their decision at different points. Some are ready to convert before they read anything — they are returning visitors or very warm referrals. Some need to read your social proof first. Some need to get to the bottom of the page before they are convinced. Having a CTA at each of these decision points means you capture each visitor at the moment they are ready.

KEY TAKEAWAYS

- ✓ Going changed 'Start Free Trial' to 'Get Premium Access'. Trial starts increased 104%. The principle: CTAs should describe what the visitor receives, not what they have to do.
- ✓ First-person CTA language ('Start my free trial') outperforms second-person ('Start your free trial') by up to 90% CTR in replicated experiments.
- ✓ Adding urgency language ('now', 'today') produces approximately 10% CTR improvement consistently across contexts.
- ✓ Repeat your CTA at least three times on any page longer than 500 words: hero, mid-page after social proof, and bottom.

SECTION 3 THE FUNNEL

A landing page is not the whole funnel. It is the entrance. Section 3 covers the three elements of the conversion funnel that most landing page guides ignore: the trial model you choose, the speed at which your pages load, and whether you are matching the right page to the right visitor.

Chapter 8 – Free Trials, Freemium, and Choosing the Right Model

The trial model you choose is one of the most consequential decisions in your conversion funnel. It affects not just how many people start a trial, but how many of those people become paying customers — and it cannot be easily changed once you have built your user acquisition around it.

There are three main models. Each has a different conversion profile, and the right choice depends on where you are in your business.

The three models and their numbers

All data in this section comes from First Page Sage's benchmark report based on 86 SaaS clients tracked from 2021 to 2025, and ProductLed's benchmarks from 600+ SaaS companies.

MODEL	VISITOR → TRIAL/SIGNUP	TRIAL → PAID
Opt-in free trial (no credit card required)	8.5% from organic traffic	18.2%
Opt-out free trial (credit card required)	4-5% (42-50% reduction vs opt-in)	48.8%
Freemium (always free tier)	13.3%	2.6%

The freemium model gets the most sign-ups — 13.3% of visitors — but converts only 2.6% of those sign-ups to paid. The opt-out model gets far

fewer sign-ups but converts nearly half of them to paid. The opt-in free trial sits in the middle on both dimensions.

How to choose

The right model depends on your goals at your current stage.

If you are a new SaaS company with no existing user base and you need to build momentum, opt-in free trial is usually the right choice. It maximises the number of people who experience your product, which maximises your opportunity to find your early fans and learn from their behaviour.

If you have an established product with a clear value proposition and a strong trial-to-paid conversion track record, opt-out (credit card required) dramatically improves monetisation at the cost of trial volume. It also acts as a self-selection filter — visitors who provide a credit card are more serious buyers, and your support costs and churn rate tend to be lower.

Freemium works when your product has natural viral mechanics — when using the product generates referrals, as with collaboration tools, communication platforms, and file-sharing products. Slack and Canva are the canonical examples. Without those viral mechanics, freemium often produces high sign-up volume with low monetisation.

Canva uses freemium but achieves 6% free-to-paid conversion — above the 2-5% industry average.

The reason: Canva does not have hard paywalls. It integrates premium feature previews within the free UX.

When a free user tries to access a premium template, they see a preview of what it looks like

and are prompted to upgrade to access it. The upgrade prompt appears at the moment of desired use,

not as an arbitrary paywall.

This contextual upgrade design converts free users at higher rates because the visitor

understands immediately what they are getting for their money.

Source: Pathmonk Free-to-Paid Conversion Analysis.

The trial length question

Most SaaS companies default to a 30-day trial. The data suggests this may be too long.

1Capture's benchmark study of 10,000+ SaaS companies found that 7 to 14-day trials combined with urgency signals — countdown timers, expiry notifications, day-by-day email sequences — outperform 30-day trials by 71%. The reason is activation: shorter trials with urgency create a reason to explore the product now rather than leaving it for later.

The 30-day trial creates the illusion of time to explore, which most users never actually use. They sign up, intend to come back, forget, and the trial expires without them reaching the 'aha moment'. A 14-day trial with a well-designed onboarding sequence tends to get more users to that moment.

PRO TIP Time-to-first-value

The strongest predictor of trial-to-paid conversion is not trial length. It is how quickly the user reaches their first value moment — the specific instant when they experience what makes your product worth paying for. Every 10 minutes of delay in reaching that moment costs 8% in trial conversion. Design your onboarding so the first value moment happens in under 10 minutes. Everything else in trial conversion follows from

that.

Product Qualified Leads: the conversion multiplier

ProductLed's benchmark study of 600+ SaaS companies found that companies using Product Qualified Leads — PQLs — achieve approximately 25% trial-to-paid conversion rates versus approximately 9% for companies that don't. Three times better.

A PQL is a free trial user who has exhibited specific product behaviours that indicate they are ready to buy — not just a trial user who has reached a certain number of days. Companies using PQL scoring trigger sales outreach based on product signals: a user who has imported data, created more than three projects, and invited a colleague is a PQL. A user who logged in once and never returned is not.

Implementing PQL scoring does not require complex technology. It requires deciding which product behaviours correlate with paid conversion — which you can identify by looking at what your current paying customers did in their first week of trial — and setting up alerts when free trial users exhibit those behaviours.

KEY TAKEAWAYS

- ✓ Opt-in free trial: 8.5% visitor→trial, 18.2% trial→paid. Opt-out: 4–5% visitor→trial, 48.8% trial→paid. Choose based on stage and viral mechanics.
- ✓ 7–14 day trials with urgency signals outperform 30-day trials by 71%. Shorter trials with good onboarding get more users to first value faster.
- ✓ Time-to-first-value is the strongest predictor of trial-to-paid conversion. Every 10 minutes of delay costs 8% in conversion. Target under 10 minutes.
- ✓ PQL-driven conversion is 3× the non-PQL median (25% vs 9%). Identify which product behaviours predict paid conversion and trigger sales on those signals.

Chapter 9 — Speed: the Conversion Lever Nobody Takes Seriously

I am going to give you three numbers that I want you to take seriously.

Amazon measured that every 100 milliseconds of latency costs them 1% in sales. Walmart measured that every one-second improvement in page load time increases their conversion rate by 2%. Google measured that adding 0.5 seconds of delay to their search page reduced traffic by 20%.

These are not small companies running marginal experiments. These are some of the largest digital businesses in the world, running properly controlled studies, and finding that page speed is one of the most direct conversion levers available.

Most SaaS landing pages are slower than they should be. And most founders treat speed as a technical concern rather than a conversion concern. That framing is expensive.

The mobile speed crisis

Google's mobile speed benchmark data found that 53% of mobile users abandon a website if it takes more than three seconds to load. SaaS mobile traffic now represents approximately 79% of total landing page traffic. If your page takes four seconds to load on a phone, you are losing more than half your mobile visitors before they have seen a single word of your copy.

53%

Of mobile visitors abandon pages that take 3+ seconds to load

Google Mobile Speed Benchmarks. With mobile accounting for 79% of SaaS landing page traffic, slow mobile load times are the largest single source of conversion loss for most SaaS

pages.

Check your mobile load time right now using Google PageSpeed Insights. It is free and takes two minutes. If your LCP — Largest Contentful Paint — is above 2.5 seconds on mobile, you have an immediate conversion problem that is bigger than anything your CTA copy is doing.

The Core Web Vitals business case

Google's Core Web Vitals — LCP, INP, and CLS — are not just SEO metrics. They are conversion metrics. Rakuten 24's investment in Core Web Vitals optimisation produced a 53.37% increase in revenue per visitor and a 33.13% increase in conversion rate. Vodafone's improvement of their LCP by 31% produced a 15% increase in leads and an 8% increase in sales.

These are not software companies with unlimited engineering resources. They are companies that prioritised page speed as a revenue investment rather than a technical maintenance task — and measured the result in direct revenue terms.

COMPANY	SPEED IMPROVEMENT	BUSINESS RESULT
Walmart	1 second load time improvement	2% conversion rate increase
Vodafone	31% LCP improvement	15% more leads, 8% more sales
Rakuten 24	Core Web Vitals programme	Revenue per visitor +53.37%, CVR +33.13%
Amazon	100ms latency reduction	1% more sales

Google0.5s delay removed from
search20% traffic recovery

PRO TIP The three fastest speed wins

For most SaaS landing pages: 1) Compress images and convert to WebP format — images are usually 60–70% of page weight. 2) Remove unused third-party scripts — every analytics, chat, and marketing tool you have installed adds load time. Audit monthly. 3) Use a CDN — serving your page from a server geographically close to your visitors reduces latency significantly. These three changes alone usually cut load time in half.

Speed as a direct revenue calculation

Here is a way to think about speed that makes the business case concrete.

If your page gets 10,000 visitors per month, converts at 3%, and your average customer lifetime value is £500 — your page is generating £150,000 of revenue per month. If a one-second improvement in load time increases your conversion rate by 2% — from 3% to 3.06% — that is 6 additional conversions per month, or £3,000 in additional monthly revenue. That is £36,000 per year from one second of speed improvement.

Speed work is not a technical cost centre. It is a revenue investment with a calculable return.

KEY TAKEAWAYS

- ✓ Amazon: 100ms latency = 1% sales loss. Walmart: 1 second improvement = 2% conversion rate increase. Speed is a direct revenue lever.
- ✓ 53% of mobile visitors abandon pages that take 3+ seconds to load. Check your mobile LCP in Google PageSpeed Insights today.

- ✓ Rakuten 24's Core Web Vitals programme produced +53.37% revenue per visitor and +33.13% conversion rate. This is not a marginal effect.
- ✓ The three fastest wins: compress and WebP your images, audit and remove unused third-party scripts, add a CDN.

Chapter 10 — Personalisation, AI Routing, and Traffic Matching

The same person in different contexts responds to different messages. Someone searching for project management software at 9am on a Tuesday when they have just missed a deadline responds differently from the same person browsing casually on a Saturday afternoon. Someone from a healthcare company responds differently from someone from a media agency.

Personalisation — showing different versions of your landing page to different visitors based on who they are or where they came from — is one of the highest-leverage conversion improvements available to companies with enough traffic to implement it properly.

Traffic source matching: the easiest personalisation

The simplest and most impactful form of personalisation is matching your landing page message to the traffic source. When a visitor's ad said 'Project management for design agencies' and your landing page headline also says 'Project management for design agencies', conversion rates increase significantly. When the ad said one thing and the page says something generic, there is a perceptual gap — and that gap costs conversions.

School of Rock's experiment demonstrated this directly. PPC traffic sent to a campaign-specific landing page with matched messaging doubled the conversion rate compared to traffic sent to the generic homepage. The page and the ad were in agreement. That agreement reduces friction.

PRO TIP UTM-based personalisation

If you are running paid campaigns, use UTM parameters to identify which campaign sent each visitor. Set up your landing page to display the headline and subheadline that matches the campaign's messaging. Most CMS platforms can do this without custom development. The implementation takes a few hours and the impact is immediate.

AI traffic routing: the next level

Traditional A/B testing shows variant A to 50% of visitors and variant B to the other 50%, regardless of who those visitors are. AI-based traffic routing — used by tools like Unbounce's Smart Traffic — analyses visitor attributes and sends each visitor to the variant most likely to convert for them, rather than splitting traffic randomly.

World of Wonder, the production company behind RuPaul's Drag Race, used Unbounce's AI routing for a streaming service landing page. The result: conversion rate reached 29.7%, approximately 20% above what the best-performing single variant achieved. The system had identified that different visitor segments responded best to different page variants — something a standard A/B test with 50/50 split would have averaged out and missed.

World of Wonder deployed AI traffic routing for their streaming service landing page.

Standard A/B testing had identified two performing variants but could not determine which visitors should see which variant.

AI routing analysed visitor attributes — source, device, time, location, and browsing signals — and routed each visitor to the variant most likely to convert for someone like them.

Result: 29.7% overall conversion rate — approximately 20% above the best single variant.

Manual A/B testing replaced by AI-managed multivariate routing permanently.

Source: Unbounce CRO Case Studies 2025.

Industry-specific personalisation

For B2B SaaS selling to multiple verticals, one of the most effective personalisation strategies is showing industry-specific testimonials and use cases to visitors who have been identified as belonging to a particular industry. A healthcare company executive responding to a case study from another healthcare company converts at a higher rate than the same executive reading a generic testimonial.

This does not require sophisticated technology. It requires having testimonials from multiple industries and showing the most relevant one based on available visitor data — the company name in the URL, the referring source, or a query parameter from the ad that sent them.

KEY TAKEAWAYS

- ✓ Traffic source matching — showing a headline and page copy that matches the ad or email that sent the visitor — consistently doubles conversion rates vs generic pages.
- ✓ AI traffic routing sends each visitor to the variant most likely to convert for them, rather than random 50/50 splits. World of Wonder achieved 29.7% conversion with 20% uplift vs best single variant.
- ✓ Industry-specific testimonials improve conversion for B2B SaaS by showing relevant social proof — a healthcare executive responds more to a healthcare case study than a generic one.
- ✓ Start with UTM-based traffic matching before investing in AI routing

tools. It is the highest-leverage, lowest-cost personalisation available.

SECTION 4 · RUNNING THE SYSTEM

Knowing what to change is only half the problem. The other half is knowing how to test whether your changes actually worked — and doing it in a way that produces reliable conclusions rather than misleading ones. Section 4 covers how to run tests properly, what mistakes to avoid, and how to sequence everything into a practical 90-day plan.

Chapter 11 — How to Run A/B Tests Properly

There is a trap that catches most founders who start running A/B tests. It is called 'peeking', and it produces results that look real but are not.

Here is how it works. You launch an A/B test. After a week, you look at the results. Variant B is converting at 5.2% and Variant A is converting at 4.1%. Variant B looks like a winner. You stop the test and implement Variant B.

Six weeks later, your conversion rate is back where it started.

Kameleoon's 2024 study found that results declared statistically significant when tests were stopped at the first point of significance were wrong 26.4% of the time. More than one in four 'winning' tests were false positives — results that appeared because of natural statistical variance, not genuine improvement.

How A/B testing actually works

Statistical significance is not a destination. It is a threshold. When a result reaches 95% statistical significance, it means there is a 95% probability that the result is real and a 5% probability that it happened by chance. If you stop every test the moment it crosses the threshold, you will stop tests during their 5% false-positive window at a rate much higher than 5% — because the threshold fluctuates during the test.

The fix is straightforward: pre-determine your sample size before you start the test, and do not look at the results until that sample size is reached. Most A/B testing calculators will tell you how many visitors you need in each variant to reach a reliable conclusion given your current conversion rate and the minimum effect size you want to detect.

PRO TIP The sample size rule

For a page converting at 3% where you want to detect a 20% improvement (from 3% to 3.6%), you need approximately 3,800 visitors per variant — 7,600 total. If your page gets 500 visitors per month, that test will take 15 months to complete. In practice, this means most early-stage SaaS companies do not have enough traffic to run statistically rigorous A/B tests on their landing pages. The alternative: run the test on a longer timeline, focus on larger changes that produce larger effects (which require smaller samples), or accept that your results are directional rather than conclusive.

The right order of operations

Before you run your first A/B test, do the qualitative work. This is the mistake that DashThis avoided — and the reason they turned 50% more free trial users into paying customers over 10 months.

DashThis used Hotjar session recordings and heatmaps to identify where users were getting stuck in their trial onboarding before writing a single test hypothesis. The recordings showed specific moments of friction — points where users hesitated, scrolled back, clicked on things that did not work, or abandoned the flow. That qualitative insight informed hypotheses that were far more likely to produce genuine improvements than guesses about what to test.

- Step 1.** Install a session recording tool — Hotjar, Microsoft Clarity (free), or equivalent. Watch at least 20 recordings of visitors who did not convert. Look for patterns: where do they hesitate, scroll back, or leave?
- Step 2.** Run a heatmap on your primary landing page. Are visitors clicking things that are not links? Are they stopping reading at a particular point? Is the CTA being clicked or ignored?
- Step 3.** From the recordings and heatmaps, write specific hypotheses. Not 'the form might be too long'. Specific: 'Removing the phone

number field will increase form completion because I can see from recordings that visitors frequently abandon after reaching that field.'

Step 4. Prioritise your hypotheses. Run the test most likely to produce the largest improvement first. Use ICE scoring — Impact, Confidence, Ease — to rank your hypotheses before you run them.

Step 5. Pre-calculate your sample size. Only look at results after reaching it. Accept the result, even if it is not what you expected.

What to test first

Given the evidence in this book, the highest-expected-impact tests for most SaaS landing pages are, in priority order:

TEST	EXPECTED IMPACT
Headline rewrite — benefit-focused vs feature-focused	High — directly addresses the most common landing page failure
Form field reduction — current count vs 3-5 fields	High — 81% abandonment rate from long forms is well documented
Add testimonials adjacent to form	High — WikiJobs saw 34% more purchases from three testimonials
CTA copy — value-focused vs process-focused	High — Going's 104% improvement from three words changed
Reading level simplification — current vs grade 7 max	Medium — requires more content change; impact is large but delayed
Page speed improvement — current vs LCP <2.5s mobile	High if slow — every second costs conversions at documented rates
KEY TAKEAWAYS	

- ✓ Stopping tests at first significance produces false positives 26.4% of the time. Pre-determine your sample size and do not look until you reach it.
- ✓ Watch session recordings before writing test hypotheses. DashThis used Hotjar data to achieve 50% more trial-to-paid conversion over 10 months.
- ✓ For most early-stage SaaS, traffic volumes are too low for statistically rigorous A/B tests. Focus on larger changes and accept directional results.
- ✓ Test in priority order: headline, form fields, testimonials, CTA copy, reading level, page speed.

Chapter 12 — Your 90-Day Conversion Improvement Plan

This chapter puts everything in this book into a sequence. Not everything at once. In the right order — starting with the changes that are free, fast, and reliably impactful, and building toward the more complex structural changes that require more investment.

If you implement this plan consistently, at the end of 90 days you will have a landing page that converts measurably better than it does today, a testing process you understand and can run independently, and a clear picture of what your specific visitors respond to.

Days 1-7: Measure and observe

Do not change anything in the first week. Your first job is to understand your current situation before you try to change it.

- Step 1.** Set up conversion tracking if you have not already. In Google Analytics 4, create an event for trial signup or account creation. If you use a tool like HubSpot or Intercom, make sure form submissions are tracked as events.
- Step 2.** Install Microsoft Clarity (free) or Hotjar (free tier available). Both give you session recordings and heatmaps. Set it live on your primary landing page.
- Step 3.** Watch 20 session recordings of visitors who did not convert. Note every point where you see hesitation, scroll-back, or abandonment. Write these down.
- Step 4.** Check your mobile page speed in Google PageSpeed Insights. Note your LCP score. If it is above 3 seconds on mobile, that is your first priority.

Step 5. Paste your landing page copy into Hemingway App. Note the current readability grade. Anything above grade 9 is a priority for simplification.

Days 8-21: Quick wins

These are the changes that require no design work, no development, and no A/B testing tool. They are also the ones with the strongest evidence behind them.

Step 1. Rewrite your main headline to be benefit-focused. Use the format: '[Your users] [achieve specific outcome] [in specific timeframe/situation]'. Test the new headline alongside the old one if you have an A/B testing tool. If not, just implement it and monitor your conversion rate.

Step 2. Add three testimonials to your page, adjacent to your lead capture form. Each testimonial should name a specific result with a specific number, and be attributed to a named person with their role and company.

Step 3. Change your CTA to value-focused language. 'Start my free trial' instead of 'Start free trial'. 'Get [Product] free' instead of 'Sign up'. Make it first-person.

Step 4. Compress your images and convert to WebP. Use Squoosh.app — free, in-browser. Replace all images on your landing page with the compressed versions.

Step 5. Remove navigation from any dedicated campaign landing pages. Keep it on your homepage and product pages.

Days 22-45: Structural improvements

These changes require slightly more work but have been demonstrated to produce significant conversion lifts.

- Step 1.** Reduce your form to five fields or fewer. Audit every field and ask: do I need this information before the user has experienced value from my product? If not, remove it. If you need more information eventually, implement a multi-step form so the first step only asks for name and email.
- Step 2.** Simplify your page copy to grade 7 or below. Paste each section into Hemingway App. For every sentence highlighted red (very hard to read), rewrite it. Break long sentences into two shorter ones. Replace jargon with plain language.
- Step 3.** Add an exit-intent popup to your pricing page for first-time visitors. Offer something genuinely useful — a relevant template, a useful guide, a checklist. Collect email in exchange.
- Step 4.** If your mobile LCP is above 2.5 seconds, prioritise fixing it now. Remove unused third-party scripts (look at your page source for analytics, chat, and marketing scripts you are not actively using). Add lazy loading to images below the fold.

Days 46-90: Test and iterate

By day 45, you will have made the highest-confidence no-code changes. Now you run structured tests on the elements most likely to produce further improvement.

- Step 1.** Calculate your sample size for A/B testing. Use a free calculator — Evan Miller's sample size calculator is reliable. Given your current traffic and conversion rate, work out how long a test needs to run to produce a reliable result.
- Step 2.** Run your first A/B test on whichever hypothesis from your session recording observations had the clearest friction signal. Write down the hypothesis before you start. Pre-commit to how long you will run it.
- Step 3.** If you are running paid campaigns, create campaign-specific landing pages matching the exact messaging of your top three ad groups. Measure conversion rate before and after.

Step 4. Review the DashThis approach: watch session recordings of trial users who did not convert to paid. Identify the friction points in your onboarding, not just your landing page. The landing page conversion feeds a trial that feeds paid conversion. Fix the weakest link.

Step 5. At day 90, compare your current conversion rate to your day-1 baseline. Calculate the revenue impact of the improvement. Use that calculation to prioritise the next 90 days.

The table to carry with you

CHANGE	TIME TO IMPLEMENT	EXPECTED LIFT
Benefit-focused headline	2 hours	Potentially large — most common landing page failure
3 testimonials adjacent to form	2 hours	34% more conversions documented (WikiJobs)
Value-focused CTA copy	30 minutes	Up to 104% improvement (Going)
Image compression + WebP	2 hours	Variable — depends on current page speed
Form field reduction to 5 or fewer	1 hour	160% improvement at extreme (11→4 fields)
Multi-step form	1 day	300% improvement (Venture Harbour)
Exit-intent popup on pricing page	Half day	403 leads in 3 weeks (Hotjar)
Copy simplification to grade 7	4 hours	6× difference between grade extremes
Campaign-specific	1 day per page	2× conversion rate (School of

landing pages		Rock)
Mobile speed below 2.5s LCP	1 day	2% CVR per second improvement (Walmart)

Start at the top of that table. Work down. Document your baseline before each change and measure after. That is the entire system.

The founders who improve their conversion rates consistently are not the ones with the most sophisticated tools or the largest teams. They are the ones who run the simplest changes, measure them honestly, and keep going when the results are slower than expected. The compounding effect of a 10% improvement here and a 15% improvement there adds up to something significant over time.

Your visitors are ready to convert. Your job is to remove the reasons they don't.

KEY TAKEAWAYS

- ✓ Days 1–7: measure. Watch session recordings. Check speed and readability. Do not change anything yet.
- ✓ Days 8–21: quick wins. New headline, three testimonials, value-focused CTA, compressed images, remove nav from campaign pages.
- ✓ Days 22–45: structural changes. Form reduction, copy simplification, exit-intent popup, mobile speed.
- ✓ Days 46–90: test and iterate. Run one A/B test at a time, pre-determined sample sizes, and measure the full funnel not just landing page conversion.
